Cyclistic Case Study Q2_2021

Hezar K

2022-11-29

This is an analysis for Cyclistic Case Study for Google Data Analytics Course. This is an analysis for 2021's second quarter.

STEP ONE: INSTALL REQUIRED PACKAGES AND IMPORT DATA

Install the required packages. **Tidyverse** package to import and wrangling the data and **ggplot2** package for visualization of the data. **Lubridate** package for date parsing and **anytime** package for the datetime conversion.

- install.packages("tidyverse")
- install.packages("ggplot2")
- install.packages("lubridate")
- install.packages("anytime")

```
library(tidyverse)
```

```
## ── Attaching packages ─────────────────────────────────────── tidyverse 1.3.2 ──
## ✔ ggplot2 3.4.0      ✔ purrr   0.3.5
## ✔ tibble  3.1.8      ✔ dplyr   1.0.10
## ✔ tidyr   1.2.1      ✔ stringr 1.4.1
## ✔ readr   2.1.3      ✔ forcats 0.5.2
## ── Conflicts ────────────────────────────────────────── tidyverse_conflicts() ──
## ✖ dplyr::filter() masks stats::filter()
## ✖ dplyr::lag()    masks stats::lag()
```

```
library(lubridate)
```

```
## Loading required package: timechange
##
## Attaching package: 'lubridate'
##
## The following objects are masked from 'package:base':
##
##     date, intersect, setdiff, union
```

```
library(data.table)
```

```
##
## Attaching package: 'data.table'
##
## The following objects are masked from 'package:lubridate':
##
##     hour, isoweek, mday, minute, month, quarter, second, wday, week,
##     yday, year
##
## The following objects are masked from 'package:dplyr':
##
##     between, first, last
##
## The following object is masked from 'package:purrr':
##
##     transpose
```

```
library(ggplot2)
library(anytime)
```

Import data from local drive.

```
Apr21 <- read_csv("202104-divvy-tripdata.csv")
```

```
## Rows: 337230 Columns: 13
## ── Column specification ────────────────────────────────────────────────────────
## Delimiter: ","
## chr (9): ride_id, rideable_type, started_at, ended_at, start_station_name, s...
## dbl (4): start_lat, start_lng, end_lat, end_lng
##
## ℹ Use `spec()` to retrieve the full column specification for this data.
## ℹ Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
May21 <- read_csv("202105-divvy-tripdata.csv")
```

```
## Rows: 531633 Columns: 13
## ── Column specification ────────────────────────────────────────────────────────
## Delimiter: ","
## chr (9): ride_id, rideable_type, started_at, ended_at, start_station_name, s...
## dbl (4): start_lat, start_lng, end_lat, end_lng
##
## ℹ Use `spec()` to retrieve the full column specification for this data.
## ℹ Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
Jun21 <- read_csv("202106-divvy-tripdata.csv")
```

```
## Rows: 729595 Columns: 13
## ── Column specification ────────────────────────────────────────────────────────
## Delimiter: ","
## chr (9): ride_id, rideable_type, started_at, ended_at, start_station_name, s...
## dbl (4): start_lat, start_lng, end_lat, end_lng
##
## ℹ Use `spec()` to retrieve the full column specification for this data.
## ℹ Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

STEP TWO: EXAMINE THE DATA

Examine the dataframe for an overview of the data. Review column names, **colnames()**. Then, we need to combine all data one dataframe. Then we examine dataframes to find dimensions, **dim()**, the first, **head()**, and the last, **tail()**, six rows in the dataframe, the summary, **summary()**, statistics on the columns of the dataframe, and review the data type structure of columns, **str()**.

```
colnames(Apr21)
```

```
##  [1] "ride_id"            "rideable_type"      "started_at"
##  [4] "ended_at"           "start_station_name" "start_station_id"
##  [7] "end_station_name"   "end_station_id"     "start_lat"
## [10] "start_lng"          "end_lat"            "end_lng"
## [13] "member_casual"
```

```
colnames(May21)
```

```
##  [1] "ride_id"            "rideable_type"      "started_at"
##  [4] "ended_at"           "start_station_name" "start_station_id"
##  [7] "end_station_name"   "end_station_id"     "start_lat"
## [10] "start_lng"          "end_lat"            "end_lng"
## [13] "member_casual"
```

```
colnames(Jun21)
```

```
##  [1] "ride_id"            "rideable_type"      "started_at"
##  [4] "ended_at"           "start_station_name" "start_station_id"
##  [7] "end_station_name"   "end_station_id"     "start_lat"
## [10] "start_lng"          "end_lat"            "end_lng"
## [13] "member_casual"
```

Since all column names are the same. We can combine the data for each month into quarters.

```
q2_2021 <- bind_rows(Apr21, May21, Jun21)
```

```
View(q2_2021)
```

```
nrow(q2_2021)
```

```
## [1] 1598458
```

```
dim(q2_2021)
```

```
## [1] 1598458      13
```

```
head(q2_2021)
```

```

```

Columns *started_at* and *ended_at* need to be convert from character data type to date data type. **Str()** syntax confirms changes.

```
q2_2021$started_at <- mdy_hm(q2_2021$started_at)
q2_2021$ended_at <- mdy_hm(q2_2021$ended_at)
str(q2_2021)
```

##   ..   start_lng = col_double(),
##   ..   end_lat = col_double(),
##   ..   end_lng = col_double(),
##   ..   member_casual = col_character()
##   .. )
##  - attr(*, "problems")=<externalptr>
```

Create new columns as for *date*, *month*, *day*, *year*, *day_of_week*, and *ride_length* in seconds.

```
q2_2021$date <- as.Date(q2_2021$started_at)
q2_2021$month <- format(as.Date(q2_2021$date), "%m")
q2_2021$day <- format(as.Date(q2_2021$date), "%d")
q2_2021$year <- format(as.Date(q2_2021$date), "%Y")
q2_2021$day_of_week <- format(as.Date(q2_2021$date), "%A")
q2_2021$ride_length <- difftime(q2_2021$ended_at,q2_2021$started_at)
```

Convert *ride_length* column to numeric in order to run calculations on the data. First, check to see if the data type is numeric, and then convert if needed.

```
is.numeric(q2_2021$ride_length)
```

```
## [1] FALSE
```

Recheck *ride_length* data type.

```
q2_2021$ride_length <- as.numeric(as.character(q2_2021$ride_length))
is.numeric(q2_2021$ride_length)
```

```
## [1] TRUE
```

STEP THREE: CLEAN DATA

na.omit() will remove all NA from the dataframe.

```
q2_2021 <- na.omit(q2_2021)
```

Remove rows with the *ride_id* column character length is not 16. This will remove all the scientific ride ids that we noticed while examining the data.

```
q2_2021 <- subset(q2_2021, nchar(as.character(ride_id)) == 16)
```

Remove rows with the *ride_length* less than 1 minute.

```
q2_2021 <- subset (q2_2021, ride_length > "1")
```

STEP FOUR: ANALYZE DATA

Analyze the dataframe by find the **mean**, **median**, **max** (maximum), and **min** (minimum) of *ride_length*.

```
mean(q2_2021$ride_length)
```

```
## [1] 1564.606
```

```
median(q2_2021$ride_length)
```

```
## [1] 840
```

```
max(q2_2021$ride_length)
```

```
## [1] 3356640
```

```
min(q2_2021$ride_length)
```

```
## [1] 60
```

Run a statistical summary of the *ride_length*.

```
summary(q2_2021$ride_length)
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      60     480     840    1565    1500 3356640
```

Compare the members and casual users

```
aggregate(q2_2021$ride_length ~ q2_2021$member_casual, FUN = mean)
```

```
##   q2_2021$member_casual q2_2021$ride_length
## 1                casual           2346.1085
## 2                member            862.3596
```

```
aggregate(q2_2021$ride_length ~ q2_2021$member_casual, FUN = median)
```

```
##   q2_2021$member_casual q2_2021$ride_length
## 1                casual                1140
## 2                member                 660
```

```
aggregate(q2_2021$ride_length ~ q2_2021$member_casual, FUN = max)
```

```
##   q2_2021$member_casual q2_2021$ride_length
## 1                casual             3356640
## 2                member               89700
```

```
aggregate(q2_2021$ride_length ~ q2_2021$member_casual, FUN = min)
```

```
##   q2_2021$member_casual q2_2021$ride_length
## 1                casual                  60
## 2                member                  60
```

Aggregate the average ride length by each day of the week for members and users.

```
aggregate(q2_2021$ride_length ~ q2_2021$member_casual + q2_2021$day_of_week, FUN = mean)
```

```
##    q2_2021$member_casual q2_2021$day_of_week q2_2021$ride_length
## 1                 casual              Friday           2311.8924
## 2                 member              Friday            831.8247

## 14                member           Wednesday            811.8137
```

Sort the days of the week in order.

```
q2_2021$day_of_week <- ordered(q2_2021$day_of_week, levels=c("Sunday", "Monday", "Tuesday", "Wednesday", "Thursda
y", "Friday", "Saturday"))
```

Assign the aggregate the average ride length by each day of the week for members and users to x.

```
x <- aggregate(q2_2021$ride_length ~ q2_2021$member_casual + q2_2021$day_of_week, FUN = mean)

head(x)
```

```
##   q2_2021$member_casual q2_2021$day_of_week q2_2021$ride_length
## 1                casual              Sunday           2713.2902
## 2                member              Sunday            993.6185
## 3                casual              Monday           2145.5873
## 4                member              Monday            824.9648
## 5                casual             Tuesday           2136.6155
## 6                member             Tuesday            821.3266
```

Find the average ride length of member riders and casual riders per day and assign it to y.

```
y <- q2_2021 %>%
  mutate(weekday = wday(started_at)) %>%
  group_by(member_casual, weekday) %>%
  summarise(number_of_rides = n(),
            average_duration = mean(ride_length), .groups = 'drop') %>%
  arrange(member_casual, weekday)

head(y)
```

```
## # A tibble: 6 × 4
##   member_casual weekday number_of_rides average_duration
##   <chr>           <int>           <int>            <dbl>
## 1 casual              1          135014            2713.
## 2 casual              2           70742            2146.
## 3 casual              3           71137            2137.
## 4 casual              4           67992            2145.
## 5 casual              5           61788            2018.
## 6 casual              6           87348            2312.
```

Analyze the dataframe to find the frequency of member riders, casual riders, classic bikes, docked bikes, and electric bikes.

```
table(q2_2021$member_casual)
```

```
##
## casual member
## 637677 709645
```

```
table(q2_2021$rideable_type)
```

```
##
##  classic_bike   docked_bike electric_bike
##        948278        119288        279756
```

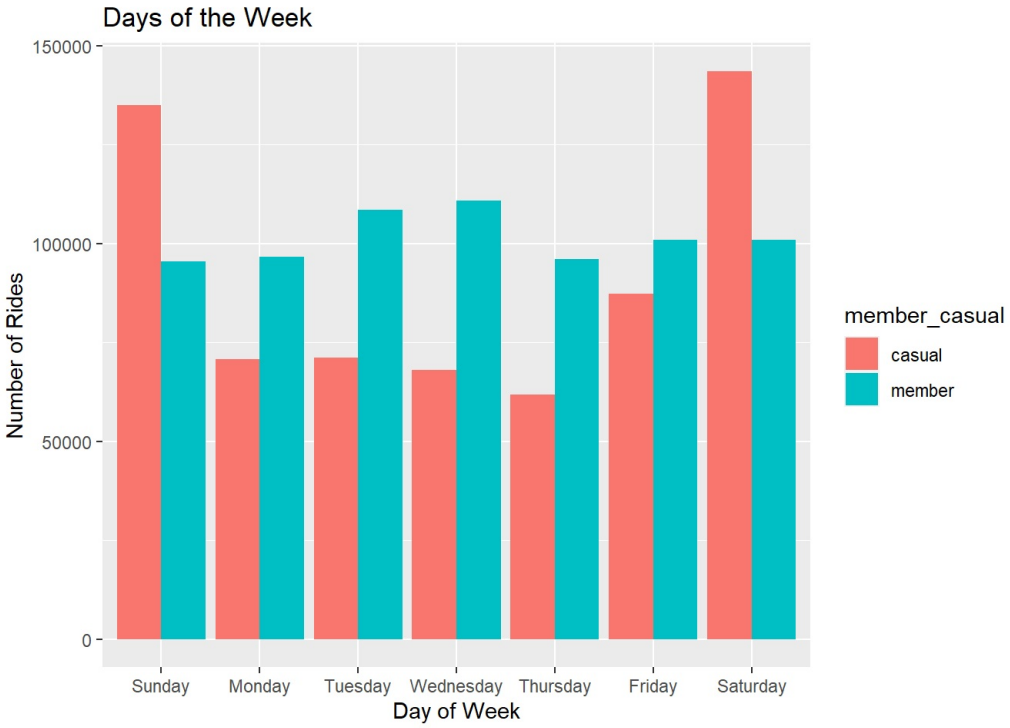
STEP FIVE: VISUALIZATION

Display full digits instead of scientific number.

```
options(scipen=999)
```

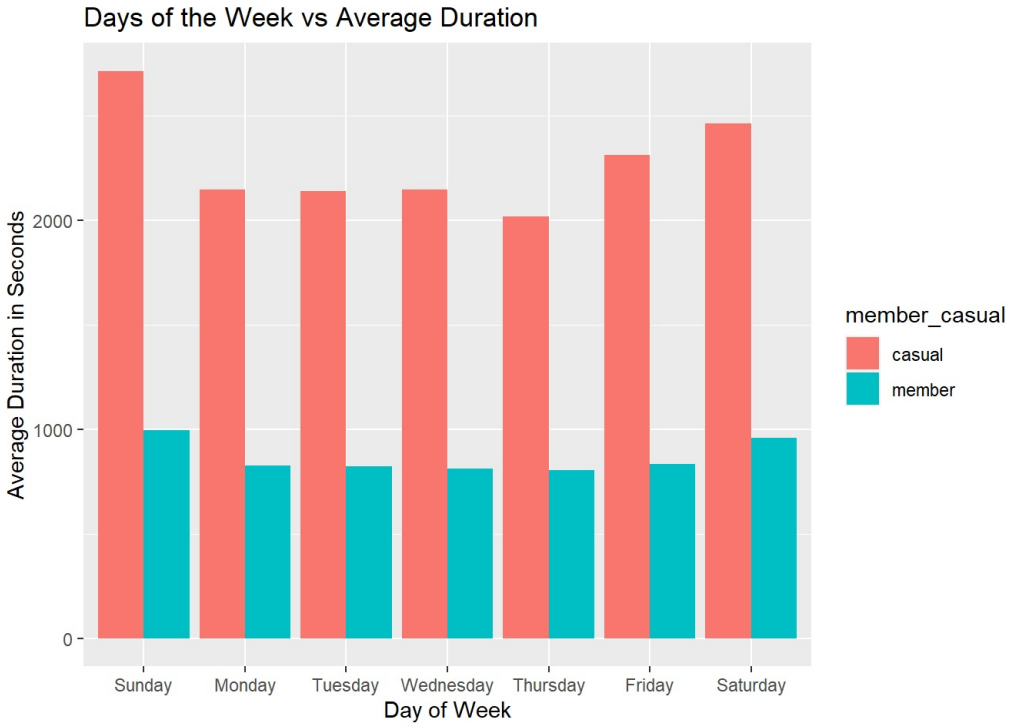
Plot the number of rides by user type during the week.

```
q2_2021 %>%
  mutate(day_of_week) %>%
  group_by(member_casual,day_of_week) %>%
  summarise(number_of_rides = n(), average_duration = mean(ride_length), .groups = 'drop') %>%
  arrange(member_casual, day_of_week)  %>%
  ggplot(aes(x = day_of_week, y = number_of_rides, fill = member_casual)) +
  geom_col(position = "dodge")+
labs(x = "Day of Week",
     y= "Number of Rides",
     title= "Days of the Week")
```



Plot the duration of the ride by user type during the week.

```
q2_2021 %>%
  mutate(day_of_week) %>%
  group_by(member_casual, day_of_week) %>%
  summarise(number_of_rides = n(), average_duration = mean(ride_length), .groups = 'drop') %>%
  arrange(member_casual, day_of_week)  %>%
  ggplot(aes(x = day_of_week, y = average_duration, fill = member_casual)) +
  geom_col(position = "dodge") +
  labs(x = "Day of Week",
       y= "Average Duration in Seconds",
       title= "Days of the Week vs Average Duration")
```



Create new dataframe for plots for weekday trends vs weekend trends.

```
mc<- as.data.frame(table(q2_2021$day_of_week,q2_2021$member_casual))
```

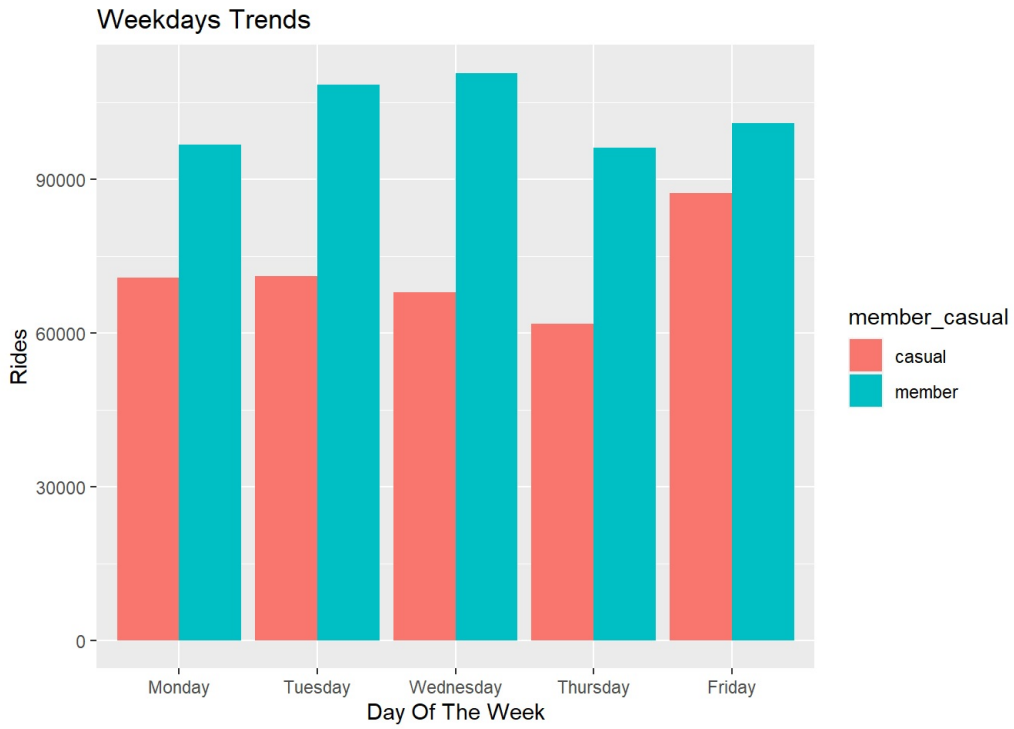
Rename columns

```
mc<-rename(mc, day_of_week = Var1, member_casual = Var2)
head(mc)
```

```
##   day_of_week member_casual   Freq
## 1      Sunday        casual 135014
## 2      Monday        casual  70742
## 3     Tuesday        casual  71137
## 4   Wednesday        casual  67992
## 5    Thursday        casual  61788
## 6      Friday        casual  87348
```

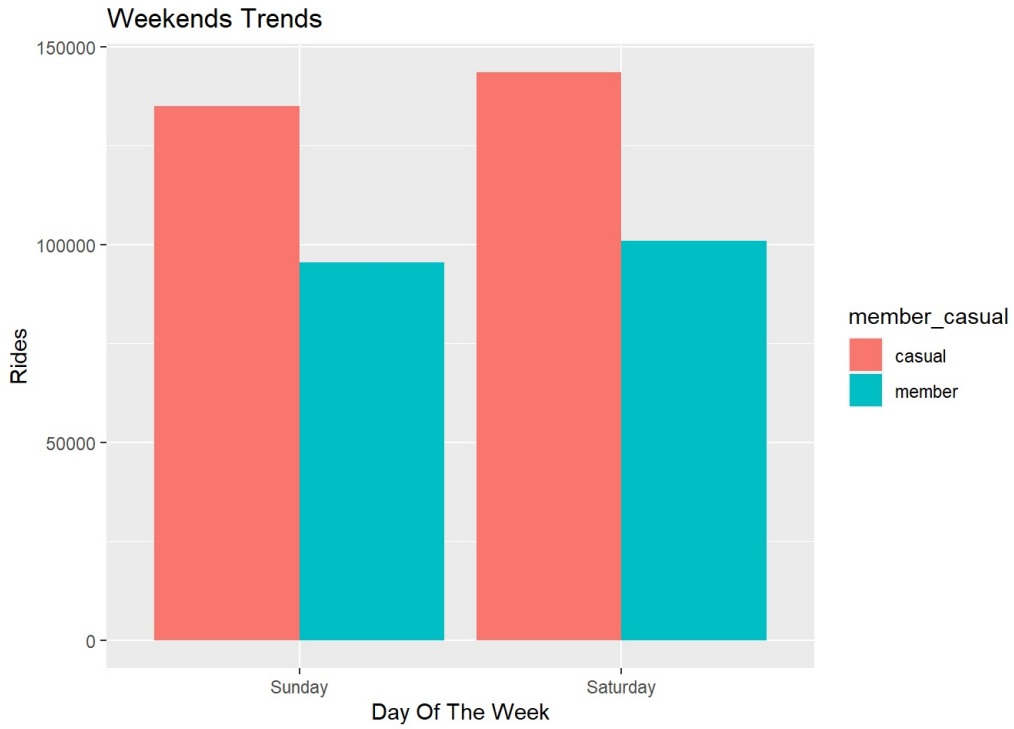
Weekday trends (Monday through Friday).

```
mc %>%
  filter(day_of_week == "Monday" |
           day_of_week == "Tuesday" |
           day_of_week == "Wednesday" |
           day_of_week == "Thursday" |
           day_of_week == "Friday") %>%
  ggplot(aes(x = day_of_week, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity" , position = "dodge") +
  labs(title = "Weekdays Trends",
       x= "Day Of The Week",
       y = "Rides")
```



Weekend trends (Sunday and Saturday).

```
mc %>%
  filter(day_of_week == "Sunday" |
           day_of_week == "Saturday") %>%
  ggplot(aes(x = day_of_week, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity", position = "dodge") +
  labs(title = "Weekends Trends",
       x= "Day Of The Week",
       y = "Rides")
```



Create dataframe for member and casual riders vs ride type

```
rt<- as.data.frame(table(q2_2021$rideable_type,q2_2021$member_casual))
```

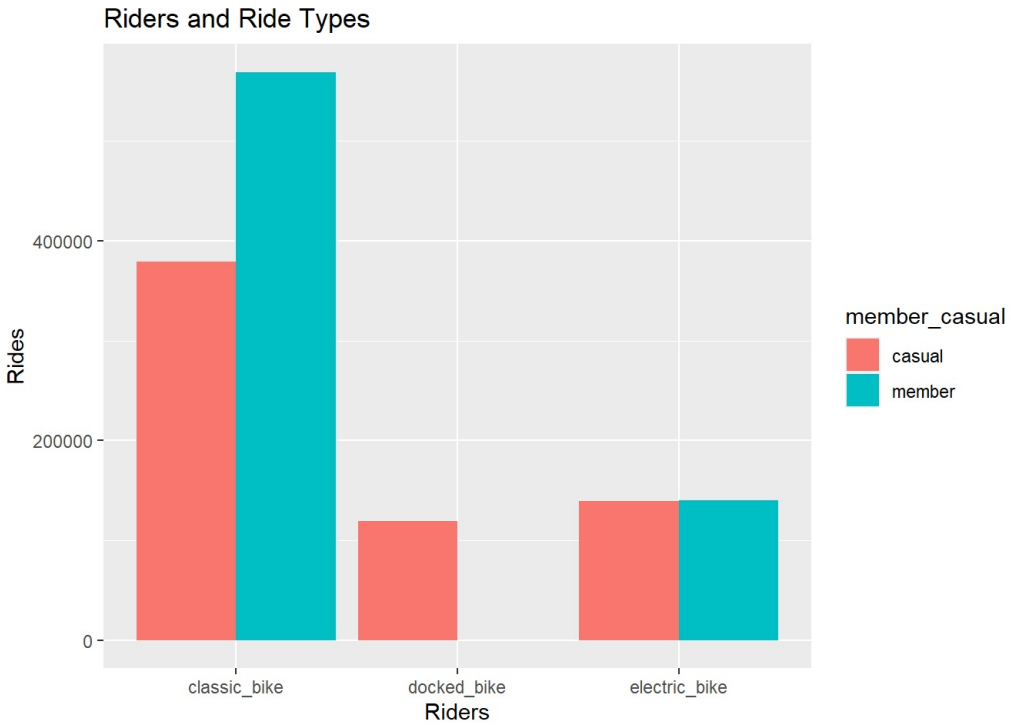
Rename columns.

```
rt<-rename(rt, rideable_type = Var1, member_casual = Var2)
head(rt)
```

```
##   rideable_type member_casual   Freq
## 1  classic_bike        casual 378965
## 2   docked_bike        casual 119288
## 3 electric_bike        casual 139424
## 4  classic_bike        member 569313
## 5   docked_bike        member      0
## 6 electric_bike        member 140332
```

Plot for bike user vs bike type.

```
rt %>%
  filter(member_casual == "member" |
           member_casual == "casual") %>%
  ggplot(aes(x = rideable_type, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity", position = "dodge") +
  labs(title = "Riders and Ride Types",
       x= "Riders",
       y = "Rides")
```



STEP SIX: EXPORT ANALYZED DATA

Save the analyzed data as a new file. fwrite(q2_2021, “q2_2021.csv”)
