Cyclistic Case Study Mar21

Hezar K

2022-11-29

This is an analysis for Cyclistic Case Study for Google Data Analytics Course. This is an analysis for March 2021.

STEP ONE: INSTALL REQUIRED PACKAGES AND IMPORT DATA

Install the required packages. **Tidyverse** package to import and wrangling the data and **ggplot2** package for visualization of the data. **Lubridate** package for date parsing and **anytime** package for the datetime conversion.

- install.packages(“tidyverse”)
- install.packages(“ggplot2”)
- install.packages(“lubridate”)
- install.packages(“anytime”)

```
library(tidyverse)
library(lubridate)
library(data.table)
library(ggplot2)
library(anytime)
```

Import data from local drive.

```
Mar21 <- read_csv("C:/Users/theby/Documents/202103-divvy-tripdata.csv")
```

STEP TWO: EXAMINE THE DATA

Examine the dataframe for an overview of the data. Review column names, **colnames()**, dimensions of the dataframe by row and column, **dim()**, the first, **head()**, and the last, **tail()**, six rows in the dataframe, the summary, **summary()**, statistics on the columns of the dataframe, and review the data type structure of columns, **str()**.

##   ..   start_lng = col_double(),
##   ..   end_lat = col_double(),
##   ..   end_lng = col_double(),
##   ..   member_casual = col_character()
##   .. )
##  - attr(*, "problems")=<externalptr>
```

Create new columns as for *date*, *month*, *day*, *year*, *day_of_week*, and *ride_length* in seconds.

```
Mar21$date <- as.Date(Mar21$started_at)
Mar21$month <- format(as.Date(Mar21$date), "%m")
Mar21$month <- month.name[as.numeric(Mar21$month)]
Mar21$day <- format(as.Date(Mar21$date), "%d")
Mar21$year <- format(as.Date(Mar21$date), "%Y")
Mar21$day_of_week <- format(as.Date(Mar21$date), "%A")
Mar21$ride_length <- difftime(Mar21$ended_at,Mar21$started_at)
```

Convert *ride_length* column to numeric in order to run calculations on the data. First, check to see if the data type is numeric, and then convert if needed.

```
is.numeric(Mar21$ride_length)
```

```
## [1] FALSE
```

Recheck *ride_length* data type.

```
Mar21$ride_length <- as.numeric(as.character(Mar21$ride_length))
is.numeric(Mar21$ride_length)
```

```
## [1] TRUE
```

STEP THREE: CLEAN DATA

na.omit() will remove all NA from the dataframe.

```
Mar21 <- na.omit(Mar21)
```

Remove rows with the *ride_id* column character length is not 16. This will remove all the scientific ride ids that we noticed while examining the data.

```
Mar21 <- subset(Mar21, nchar(as.character(ride_id)) == 16)
```

Remove rows with the *ride_length* less than 60 seconds or 1 minute.

```
Mar21 <- subset (Mar21, ride_length > 59)
```

STEP FOUR: ANALYZE DATA

Analyze the dataframe by find the **mean**, **median**, **max** (maximum), and **min** (minimum) of *ride_length*.

```
mean(Mar21$ride_length)
```

```
## [1] 1382.506
```

```
median(Mar21$ride_length)
```

```
## [1] 757
```

```
max(Mar21$ride_length)
```

```
## [1] 1900899
```

```
min(Mar21$ride_length)
```

```
## [1] 60
```

Run a statistical summary of the *ride_length*.

```
summary(Mar21$ride_length)
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max. 
##      60     426     757    1382    1411 1900899
```

Compare the members and casual users

```
aggregate(Mar21$ride_length ~ Mar21$member_casual, FUN = mean)
```

```
##   Mar21$member_casual Mar21$ride_length
## 1              casual         2326.5148
## 2              member          830.4462
```

```
aggregate(Mar21$ride_length ~ Mar21$member_casual, FUN = median)
```

```
##   Mar21$member_casual Mar21$ride_length
## 1              casual              1177
## 2              member               610
```

```
aggregate(Mar21$ride_length ~ Mar21$member_casual, FUN = max)
```

```
##   Mar21$member_casual Mar21$ride_length
## 1              casual           1900899
## 2              member             88022
```

```
aggregate(Mar21$ride_length ~ Mar21$member_casual, FUN = min)
```

```
##   Mar21$member_casual Mar21$ride_length
## 1              casual                60
## 2              member                60
```

Aggregate the average ride length by each day of the week for members and users.

```
aggregate(Mar21$ride_length ~ Mar21$member_casual + Mar21$day_of_week, FUN = mean)
```

```
##    Mar21$member_casual Mar21$day_of_week Mar21$ride_length
## 1               casual            Friday         1785.3258
## 2               member            Friday          755.9209
## 3               casual            Monday         2738.6136
## 4               member            Monday          835.1038
## 5               casual          Saturday         2546.0976
## 6               member          Saturday          944.7101
## 7               casual            Sunday         2484.9655
## 8               member            Sunday          967.2553
## 9               casual          Thursday         1818.6938
## 10              member          Thursday          717.0502
## 11              casual           Tuesday         2222.4294
## 12              member           Tuesday          805.6395
## 13              casual         Wednesday         1767.3636
## 14              member         Wednesday          763.3547
```

Sort the days of the week in order.

```
Mar21$day_of_week <- ordered(Mar21$day_of_week, levels=c("Sunday", "Monday", "Tuesday", "Wednesday", "Thursday",
"Friday", "Saturday"))
```

Assign the aggregate the average ride length by each day of the week for members and users to x.

```
x <- aggregate(Mar21$ride_length ~ Mar21$member_casual + Mar21$day_of_week, FUN = mean)

head(x)
```

```
##   Mar21$member_casual Mar21$day_of_week Mar21$ride_length
## 1              casual            Sunday         2484.9655
## 2              member            Sunday          967.2553
## 3              casual            Monday         2738.6136

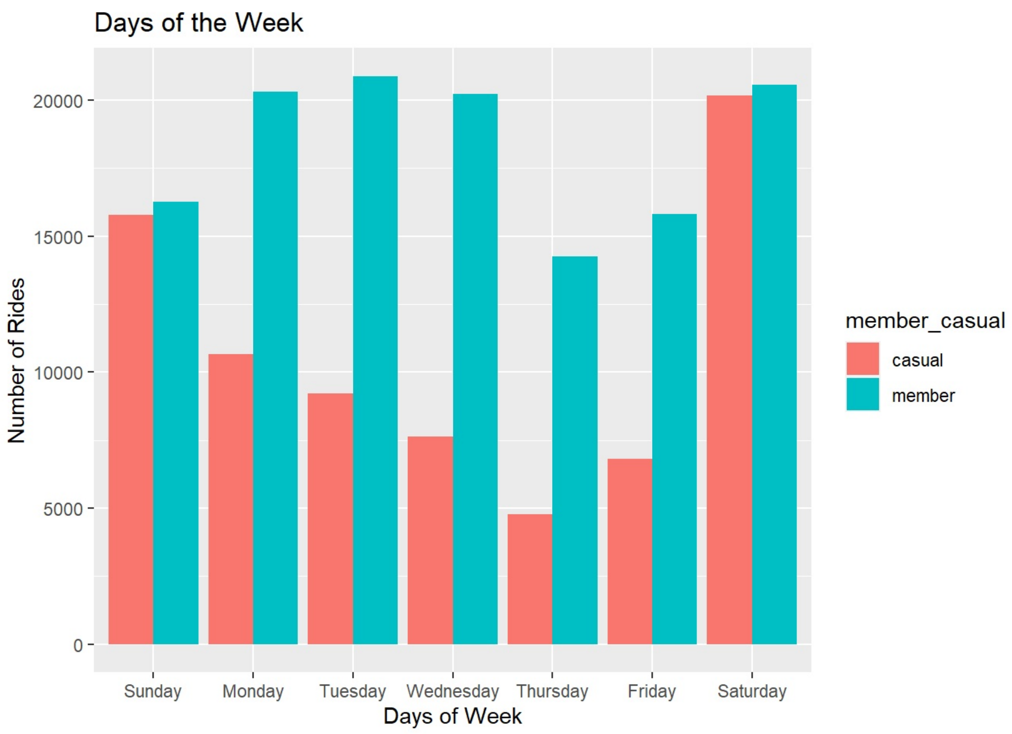
STEP FIVE: VISUALIZATION

Display full digits instead of scientific number.

```
options(scipen=999)
```

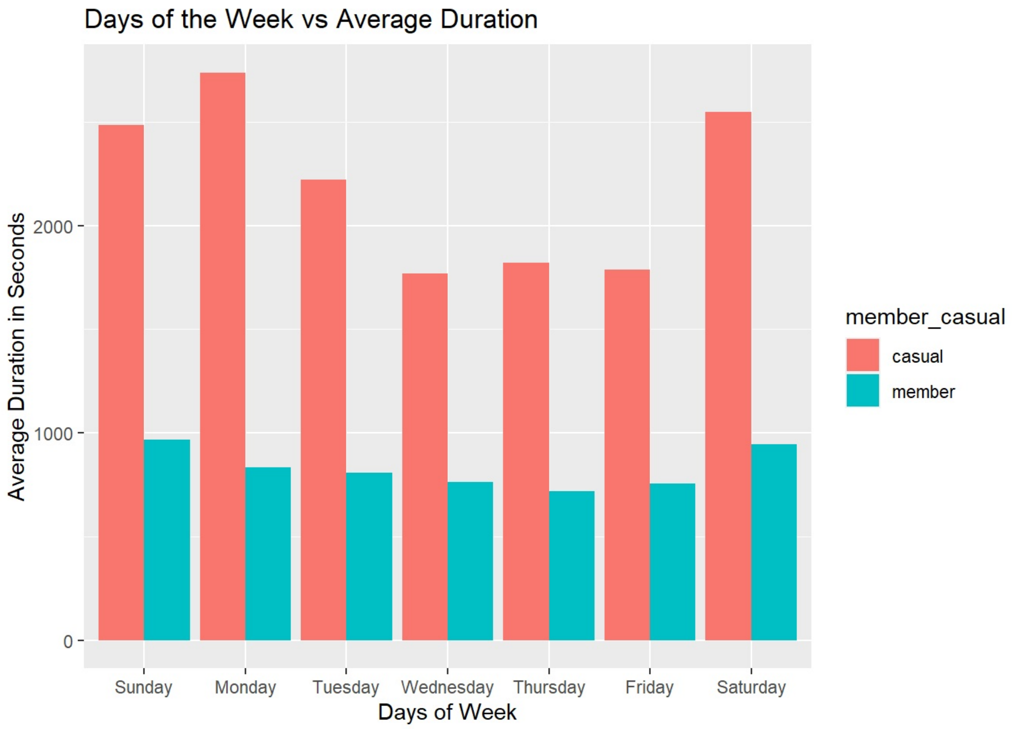
Plot the number of rides by user type during the week.

```
Mar21 %>%
  mutate(day_of_week) %>%
  group_by(member_casual,day_of_week) %>%
  summarise(number_of_rides = n(), average_duration = mean(ride_length), .groups = 'drop') %>%
  arrange(member_casual, day_of_week)  %>%
  ggplot(aes(x = day_of_week, y = number_of_rides, fill = member_casual)) +
  geom_col(position = "dodge")+
labs(x = "Days of Week",
     y= "Number of Rides",
     title= "Days of the Week")
```



Plot the duration of the ride by user type during the week.

```
Mar21 %>%
  mutate(day_of_week) %>%
  group_by(member_casual, day_of_week) %>%
  summarise(number_of_rides = n(), average_duration = mean(ride_length), .groups = 'drop') %>%
  arrange(member_casual, day_of_week)  %>%
  ggplot(aes(x = day_of_week, y = average_duration, fill = member_casual)) +
  geom_col(position = "dodge") +
  labs(x = "Days of Week",
       y= "Average Duration in Seconds",
       title= "Days of the Week vs Average Duration")
```



Create new dataframe for plots for weekday trends vs weekend trends.

```
mc<- as.data.frame(table(Mar21$day_of_week,Mar21$member_casual))
```

Rename columns

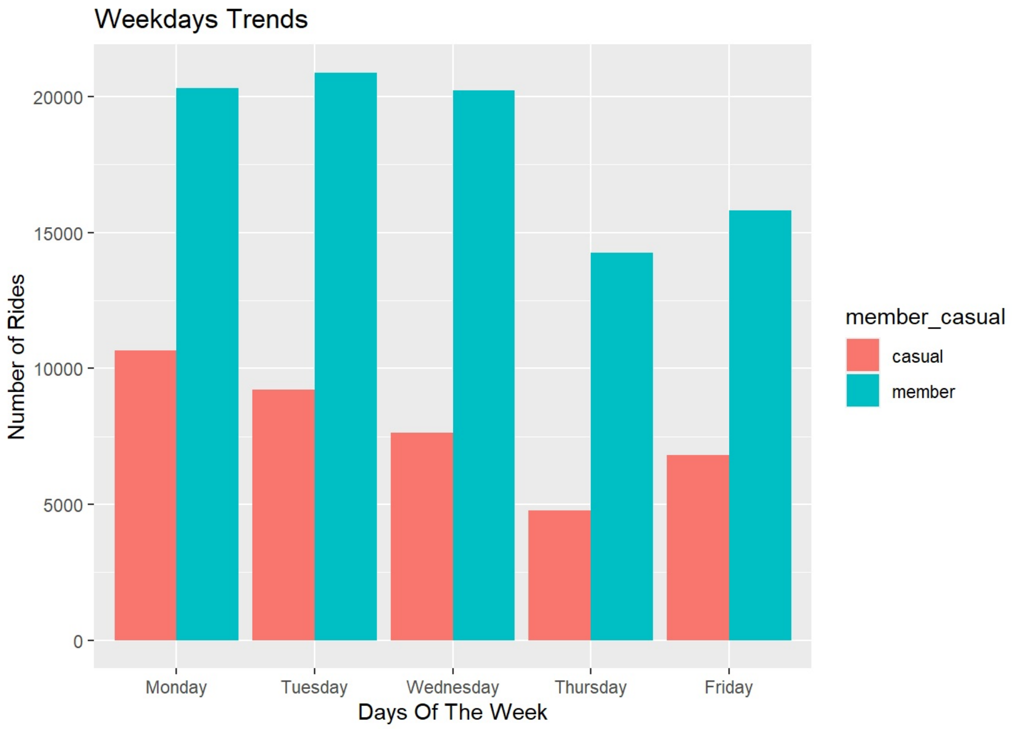
```
mc<-rename(mc, day_of_week = Var1, member_casual = Var2)

head(mc)
```

```
##   day_of_week member_casual  Freq
## 1      Sunday        casual 15794
## 2      Monday        casual 10665
## 3     Tuesday        casual  9229
## 4   Wednesday        casual  7619
## 5    Thursday        casual  4771
## 6      Friday        casual  6807
```

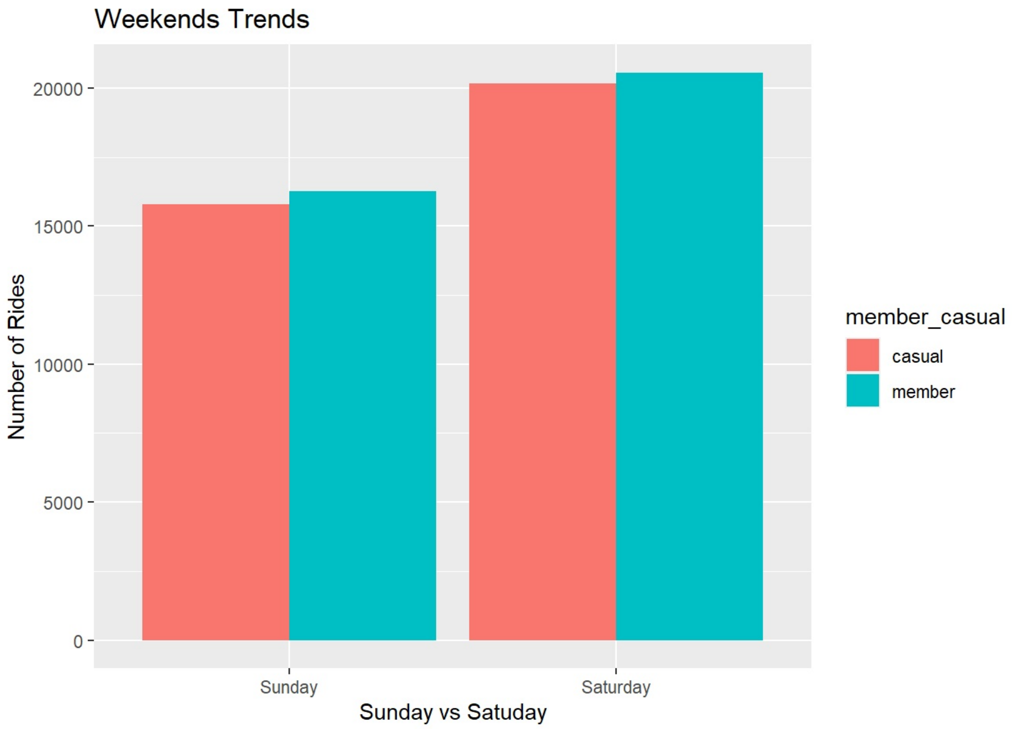
Weekday trends (Monday through Friday).

```
mc %>%
  filter(day_of_week == "Monday" |
           day_of_week == "Tuesday" |
           day_of_week == "Wednesday" |
           day_of_week == "Thursday" |
           day_of_week == "Friday") %>%
  ggplot(aes(x = day_of_week, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity" , position = "dodge") +
  labs(title = "Weekdays Trends",
       x= "Days Of The Week",
       y = "Number of Rides")
```



Weekend trends (Sunday and Saturday).

```
mc %>%
  filter(day_of_week == "Sunday" |
           day_of_week == "Saturday") %>%
  ggplot(aes(x = day_of_week, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity", position = "dodge") +
  labs(title = "Weekends Trends",
       x= "Sunday vs Satuday",
       y = "Number of Rides")
```



Create dataframe for member and casual riders vs ride type

```
rt<- as.data.frame(table(Mar21$rideable_type,Mar21$member_casual))
```

Rename columns.

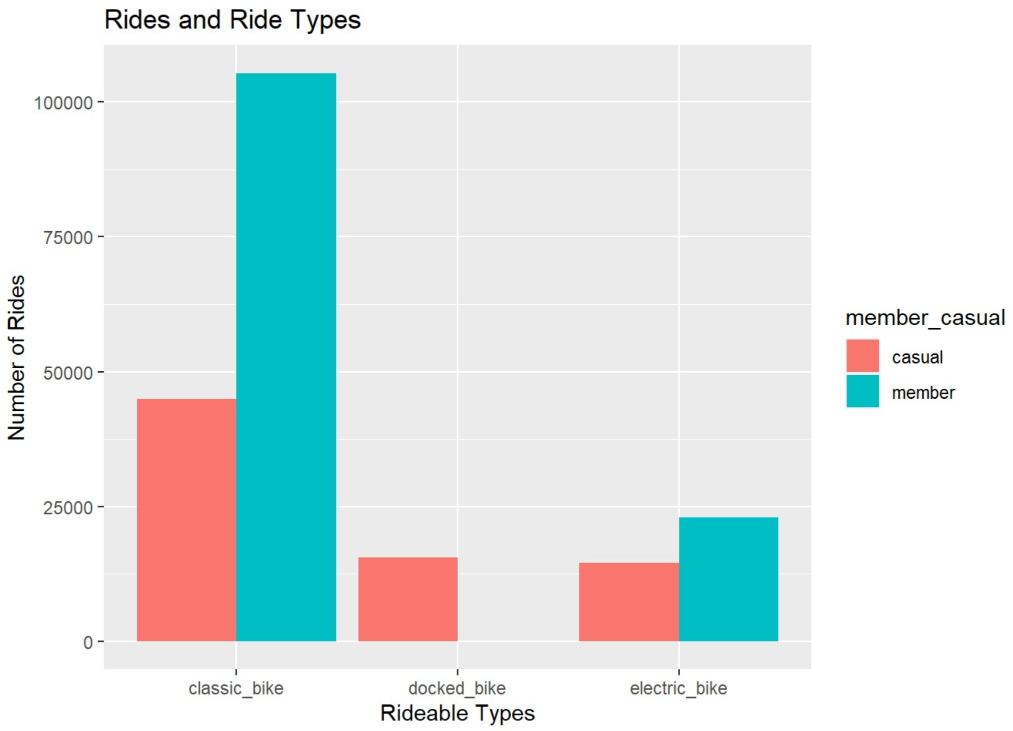
```
rt<-rename(rt, rideable_type = Var1, member_casual = Var2)

head(rt)
```

```
##    rideable_type member_casual   Freq
## 1  classic_bike        casual  44982
## 2   docked_bike        casual  15571
## 3 electric_bike        casual  14506
## 4  classic_bike        member 105408
## 5   docked_bike        member      0
## 6 electric_bike        member  22941
```

Plot for bike user vs bike type.

```
rt %>%
  filter(member_casual == "member" |
           member_casual == "casual") %>%
  ggplot(aes(x = rideable_type, y = Freq, fill = member_casual))+
  geom_bar(stat = "identity", position = "dodge") +
  labs(title = "Rides and Ride Types",
       x= "Rideable Types",
       y = "Number of Rides")
```



STEP SIX: EXPORT ANALYZED DATA

Save the analyzed data as a new file. fwrite(Mar21, “Mar21.csv”)
