# Cyclistic Case Study Oct21

### Hezar K

2022-11-29

This is an analysis for Cyclistic Case Study for Google Data Analytics Course. This is an analysis for October 2021.

### STEP ONE: INSTALL REQUIRED PACKAGES AND IMPORT DATA

Install the required packages. **Tidyverse** package to import and wrangling the data and **ggplot2** package for visualization of the data. **Lubridate** package for date parsing and **anytime** package for the datetime conversion.

- install.packages("tidyverse")
- install.packages("ggplot2")
- install.packages("lubridate")
- install.packages("anytime")

### library(tidyverse)

```
## — Attaching packages -
                                                                 – tidyverse 1.3.2 <del>–</del>
## / ggplot2 3.4.0
                        ✓ purrr
                                   0.3.5
## ✓ tibble 3.1.8

✓ dplyr

                                   1.0.10
## ✔ tidyr
             1.2.1

✓ stringr 1.4.1

           2.1.3
                        ✓ forcats 0.5.2
## ✓ readr
## — Conflicts -
                                                           – tidyverse conflicts() —
## * dplyr::filter() masks stats::filter()
## * dplyr::lag()
                     masks stats::lag()
```

### library(lubridate)

```
## Loading required package: timechange
##
## Attaching package: 'lubridate'
##
## The following objects are masked from 'package:base':
##
## date, intersect, setdiff, union
```

### library(data.table)

```
##
## Attaching package: 'data.table'
##
##
   The following objects are masked from 'package:lubridate':
##
##
       hour, isoweek, mday, minute, month, quarter, second, wday, week,
##
       yday, year
##
## The following objects are masked from 'package:dplyr':
##
##
       between, first, last
##
## The following object is masked from 'package:purrr':
##
##
       transpose
```

```
library(ggplot2)
library(anytime)
```

Import data from local drive.

```
0ct21 <- read_csv("C:/Users/theby/Documents/202110-divvy-tripdata.csv")</pre>
```

```
## Rows: 631226 Columns: 13
## — Column specification —
## Delimiter: ","
## chr (9): ride_id, rideable_type, started_at, ended_at, start_station_name, s...
## dbl (4): start_lat, start_lng, end_lat, end_lng
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

### **STEP TWO: EXAMINE THE DATA**

Examine the dataframe for an overview of the data. Review column names, colnames(), dimensions of the dataframe by row and column, dim(), the first, head(), and the last, tail(), six rows in the dataframe, the summary, summary(), statistics on the columns of the dataframe, and review the data type structure of columns, str().

View(Oct21)

```
colnames(Oct21)
    [1] "ride_id"
                                 "rideable_type"
                                                          "started_at"
    [4] "ended_at"
                                  "start_station_name"

##
    - attr(*, "problems")=<externalptr>
```

Create new columns as for date, month, day, year, day\_of\_week, and ride\_length in seconds.

```
Oct21$date <- as.Date(Oct21$started_at)
Oct21$month <- format(as.Date(Oct21$date), "%m")
Oct21$day <- format(as.Date(Oct21$date), "%d")
Oct21$year <- format(as.Date(Oct21$date), "%Y")
Oct21$year <- format(as.Date(Oct21$date), "%A")
Oct21$day_of_week <- format(as.Date(Oct21$date), "%A")
Oct21$ride_length <- difftime(Oct21$ended_at,Oct21$started_at)</pre>
```

Convert ride\_length column to numeric in order to run calculations on the data. First, check to see if the data type is numeric, and then convert if needed.

```
is.numeric(Oct21$ride_length)
```

```
## [1] FALSE
```

Recheck ride\_length data type.

```
Oct21$ride_length <- as.numeric(as.character(Oct21$ride_length))
is.numeric(Oct21$ride_length)</pre>
```

```
## [1] TRUE
```

### **STEP THREE: CLEAN DATA**

na.omit() will remove all NA from the dataframe.

```
0ct21 <- na.omit(0ct21)</pre>
```

Remove rows with the ride\_id column character length is not 16. This will remove all the scientific ride ids that we noticed while examining the data.

```
0ct21 <- subset(0ct21, nchar(as.character(ride_id)) == 16)</pre>
```

Remove rows with the ride\_length less than 1 minute.

```
0ct21 <- subset (0ct21, ride_length > "1")
```

### **STEP FOUR: ANALYZE DATA**

Analyze the dataframe by find the mean, median, max (maximum), and min (minimum) of ride length.

```
mean(Oct21$ride_length)
 ## [1] 1068.797
 median(Oct21$ride_length)
 ## [1] 660
 max(Oct21$ride_length)
 ## [1] 2442300
 min(Oct21$ride_length)
 ## [1] 60
Run a statistical summary of the ride_length.
 summary(Oct21$ride length)
 ##
       Min. 1st Qu.
                     Median
                                Mean 3rd Qu.
                                                 Max.
 ##

```

### **STEP FIVE: VISUALIZATION**

Display full digits instead of scientific number.

```
options(scipen=999)
```

Plot the number of rides by user type during the week.

# Days of the Week 50000 - 40000 - 99 30000 - 1

Tuesday Wednesday Thursday

Day of Week

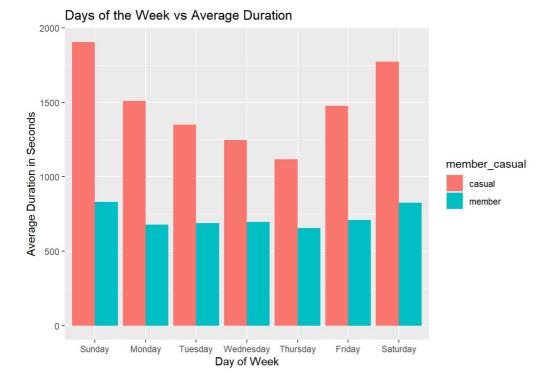

Plot the duration of the ride by user type during the week.

Monday

Sunday

Friday

Saturday

Create new dataframe for plots for weekday trends vs weekend trends.

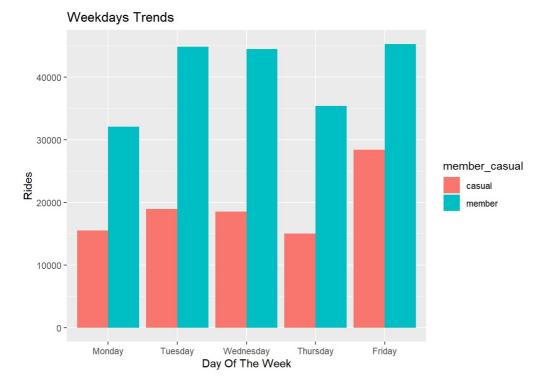

```
mc<- as.data.frame(table(Oct21$day_of_week,Oct21$member_casual))</pre>
```

### Rename columns

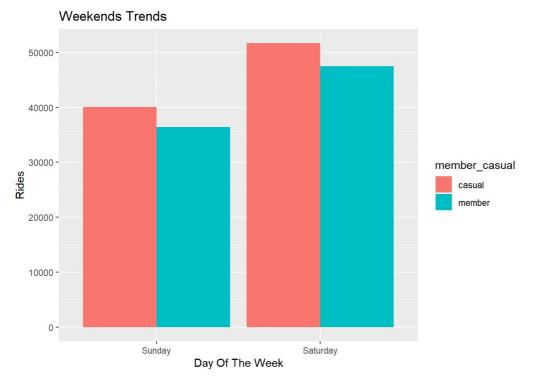

```
mc<-rename(mc, day_of_week = Var1, member_casual = Var2)
head(mc)</pre>
```

```
